

Clinical Study for Individuals Living with TSC

What is the TrustTSC Study?

The TrustTSC study is exploring whether treatment with an investigational medication (ganaxolone) has the potential to reduce the frequency of seizures associated with TSC in children and adults.

Who can participate?

- Clinical or mutational TSC diagnosis (TSC1 or TSC2 mutation confirmed by your doctor)
- 1-65 years old
- Inadequate seizure control
- Treated with at least two prior anti-epileptic drugs (AEDs)
- Not currently enrolled in any other clinical studies
